INSTRUMENTAL
THIN-LAYER CHROMATOGRAPHY

CAMAG®
WORLD LEADER IN PLANAR CHROMATOGRAPHY
CAMAG – Your partner in all fields of Planar Chromatography

CAMAG has the tradition of serving planar chromatography since 1961. We develop and manufacture sophisticated instruments and associated software for the state-of-the-art analytical technique. Our products are marketed directly in Switzerland, through daughter companies in Germany and in the USA, and through carefully selected distributors worldwide. We see ourselves as a flexible, customer friendly, science based company that has made its mark as a reliable partner in all branches of planar chromatography. We provide competent customer support and technical service for our products as well as education and training for our customers’ lab personnel.

CAMAG has everything your lab may need for planar chromatography. This catalog will help you to quickly find information about the products suitable for your tasks. The catalog may also serve as a short guide through all steps of the planar chromatography procedure. Methodological explanations are set apart from specific product information.

Please visit our homepage www.camag.com for additional information and the latest news. Our team is always available for individual questions and support.

Terminology used in this catalog

In order to emphasize that the state-of-the-art method is something different from the simple Thin-Layer Chromatography of yesterday, we are predominantly using the term Planar Chromatography but occasionally also TLC and HPTLC (High-Performance Thin-Layer Chromatography).
The samples are applied onto the plate either as spots (TLC) or as bands (HPTLC). Precision of the applied volume, exact positioning and compactness of application zone determine the quality of the final result.

The mobile phase is drawn through the stationary phase by capillary action. Samples are separated into their components which remain in their position on the layer after the mobile phase has been evaporated. Chromatography is affected by the gas phase in the chromatographic chamber.

Substances without chromophores or fluorophores can be visualized or made detectable through derivatization. The required reagents are transferred onto the chromatogram by spraying or immersion.

TLC/HPTLC chromatograms are captured images of the plates under white or ultraviolet light. Densitograms are profiles of each sample track obtained by scanning densitometry. Evaluation options range from visual inspection of electronic images to quantitative determinations using scanning densitometry or image profiles. For documentation, electronic images are easy to capture and to archive. They can be reproduced on screen without changes over time and thus compared with current images. Coupling HPTLC with Mass Spectrometry or bioluminescence detection (bioautography) expand the capability of TLC/HPTLC.

visionCATS software organizes the workflow of HPTLC, controls the involved CAMAG instruments, manages data, and generates analysis reports in conformity to cGMP/cGLP.

With a complete system a lab can efficiently start working with HPTLC.

CAMAG offers support with HPTLC feasibility studies, training, instrument qualification, literature services and more.

High-Performance Thin-Layer Chromatography

The high performance version of planar chromatography distinguishes the technique. HPTLC comprises the use of chromatographic layers of utmost separation efficiency and the employment of state-of-the-art instrumentation for all steps in the procedure, precise sample application, standardized reproducible chromatogram development and software controlled evaluation. Of course, conventional TLC, manually performed and using inexpensive equipment still has its place in almost all laboratories as a convenient tool for simple and rapid separations.

HPTLC as opposed to column chromatography (GC, HPLC) utilizes a flat (planar) stationary phase and an open system. The basic steps sample application, chromatogram development and evaluation as well as any optional ones are performed relatively independent in time and location, which, on the one hand offers unsurpassed flexibility but on the other hand makes total automation difficult. Since many samples can be processed in parallel, HPTLC is rapid and cost effective.

**Remarkable features of planar chromatography:**
In addition to chromatogram detection/evaluation under visible or ultraviolet light, pre- and postchromatographic derivatization is readily available, for which a practically unlimited variety of reagents can be used, since it is performed in the absence of the mobile phase.

Unlike with column chromatography, the user has a complete overview of the chromatogram as all fractions remain stored on the plate and any substances remaining in the start position are detectable. It is another advantage of planar chromatography that sample preparation can often be simplified, due to the one-time use of the stationary phase.

Standardized HPTLC analysis methods – qualitative or quantitative – can be validated. For customers regulated by cGMP/cGLP, we offer Installation Qualification (IQ) and Operating Qualification (OQ) for our instruments.

CAMAG’s modern software concept ensures the reliable operation of our HPTLC systems and the documentation/storage of operating parameters and results as required by the customer.

HPTLC-MS online coupling, the comparatively new hyphenation of HPTLC and mass spectrometry, has the potential to become an indispensable technique for many analytical laboratories.
Sample Application

Sample application determines quality and reproducibility of the analysis
Sample Application – Variations

Application of samples, reference standards and/or reference materials is the first step in the workflow of TLC/HPTLC and it affects significantly the quality of the result at the end of the process.

The choice of the application technique and the device depend on the requirements of precision, sample volumes, number of analyses and the desired grade of automation.

Spotwise sample application using a fixed volume capillary is the simplest way. Sample volumes of 0.5 to 5 µL can be applied as spots onto conventional layers without intermediate drying, on HPTLC layers it is up to 1 µL per spot.

Bandwise application by spray-on techniques allows the application of significantly larger volumes. Starting zones in the form of narrow bands ensure the best resolution that can be achieved with the chromatographic system selected.

Effect of the solvent and the technique of sample application on the chromatogram

Mobile phase: toluene; detection: white light

Test dye mixture (0.5 and 5 µL) dissolved in
1: methanol       2: toluene       3: hexane

Developed plate after spray-on application of bands

Developed plate after contact application of spots

Contact application, prior to development

Application of samples, reference standards and/or reference materials is the first step in the workflow of TLC/HPTLC and it affects significantly the quality of the result at the end of the process.

The choice of the application technique and the device depend on the requirements of precision, sample volumes, number of analyses and the desired grade of automation.

Spotwise sample application using a fixed volume capillary is the simplest way. Sample volumes of 0.5 to 5 µL can be applied as spots onto conventional layers without intermediate drying, on HPTLC layers it is up to 1 µL per spot.

Bandwise application by spray-on techniques allows the application of significantly larger volumes. Starting zones in the form of narrow bands ensure the best resolution that can be achieved with the chromatographic system selected.
The Nanomat 4 serves for easy application of samples in the form of spots onto TLC and HPTLC layers, precisely positioned and without damage to the layer. The actual sample dosage is performed with a disposable capillary pipette, which is precisely guided, thus ensuring that the chromatogram can be scanned automatically according to a programmed pattern.

The Nanomat 4 is suitable for

- Conventional TLC plates including self-coated plates up to 20 × 20 cm
- HPTLC plates 10 × 10 cm and 20 × 10 cm
- TLC and HPTLC sheets up to 20 × 20 cm

Camillary pipettes

The capillary pipettes are loaded into the dispenser in magazines. Capillaries of 0.5, 1.0, 2.0, and 5.0 µL volume are available. Each capillary size requires an appropriate dispenser magazine. With the Universal Capillary Holder capillary pipettes are taken from the dispenser, then filled with sample solution and placed against the applicator head of the Nanomat 4.

Further information at www.camag.com/nanomat
Automatic sample application is a key factor for productivity of the HPTLC laboratory. The ATS 4 offers fully automatic sample application for qualitative and quantitative analyses as well as for preparative separations. It is suited for routine use and high sample throughput.

Samples are either applied as spots through contact transfer (0.1–5 µL) or as bands or rectangles (0.5 to > 50 µL) using the spray-on technique. Starting zones in the form of narrow bands offer the best separation attainable with a given chromatographic system. Application in the form of rectangles allows precise application of large volumes without damaging the layer. Prior to chromatography, these rectangles are focused into narrow bands with a solvent of high elution strength.

The ATS 4 allows “overspotting”, i.e. a sequential application from different vials onto the same position. This technique can be used e.g. in pre-chromatographic derivatization, spiking, etc.

Key features
- Fully automatic sample application, suitable for routine use
- Application of spots, bands, or rectangles
- Data input and monitoring through visionCATS software
- Application of solutions onto TLC/HPTLC plates
- Application of sample volumes between 0.1 and 5 µL by contact transfer
- Spray-on application of sample volumes between 0.5 and > 50 µL
- Heated Spray Nozzle (option)

Ordering information

022.7400 CAMAG® Automatic TLC Sampler 4 (ATS 4), incl.
25 µL Dosing syringe (695.0053), Spray-on needle for dosing syringe (695.0046), Contact transfer needle for dosing syringe (695.0047), without software

022.7410 CAMAG® Automatic TLC Sampler 4 (ATS 4), with heated spray nozzle, incl. 25 µL Dosing syringe (695.0053), Spray-on needle for dosing syringe (695.0046), Contact transfer needle for dosing syringe (695.0047), without software

Note
The Automatic TLC Sampler ATS 4 with visionCATS meets all the requirements of cGMP/cGLP and can be IQ/OQ qualified. If the instrument shall be used in a 21 CFR Part 11 environment, the visionCATS option “21 CFR Part 11” is required.

Detailed ordering information: www.camag.com/ats4
Operation of the ATS 4 with visionCATS

Precise sample application is a crucial factor for the quality of the HPTLC analysis and the results obtained. When using visionCATS HPTLC software with its easy to navigate user interface to control the ATS 4, a fully automated sample application for routine use and high sample throughput is supported.

The dialog box for instrument parameters offers user-friendly default combinations. For instance, the user can select the solvent type most similar to the solvent actually used. The software will then automatically adapt the instrument defaults to optimize its application regarding viscosity, volatility and surface tension. Another example of a pre-selected combination is the filling/flushing quality which determines how often the syringe is rinsed, the filling process repeated, etc. All these pre-selections can be individually adjusted to a specific task.

The dialog for entering the sequence of samples is clearly arranged and easy to use. Tracks can be automatically arranged evenly spaced across the plate, sample designations can be inserted from a prepared list, etc. The program progress is displayed on screen as long as the instrument remains connected to the computer.

Easy sequence setup with visionCATS: the sequence table holds all information required to fully automated run a series of samples, e.g. sample location (rack position and application position), sample volume, sample name, etc.
With the Linomat 5 samples are sprayed onto TLC/HPTLC plates in the form of bands with nitrogen or compressed air. Sample application is automatic, only changing the syringe (filling, inserting and rinsing) is manual. The Linomat is suitable for small sample throughput.

Software-controlled operation with visionCATS
The Linomat 5 is controlled by visionCATS, the new generation of HPTLC software. Instrument handling is now easier and more convenient. Simply select a plate format, fill in the sequence table and start working. With visionCATS, the Linomat 5 can be IQ/OQ qualified and used in a cGMP environment.

Chromatogram Development

Chromatogram development under reproducible standardized conditions is a key to the quality of the result.
TLC and HPTLC differ from all other chromatographic techniques in the fact that in addition to stationary and mobile phases, a gas phase is present. This gas phase can significantly influence the result of the separation.

The following considerations primarily concern silica gel as stationary phase and a process usually described as adsorption chromatography.

**In the developing chamber four partially competing processes occur:**

1. Between the components of the developing solvent and its vapor, an equilibrium will be established gradually. This process is called chamber saturation. Depending on the vapor pressure of the solvent components the composition of the gas phase can differ from that of the developing solvent.

2. The part of the layer which is already wetted with mobile phase contributes to the formation of the equilibrium.

3. While still dry, the stationary phase adsorbs molecules from the gas phase. Thereby polar components will be preferentially withdrawn from the gas phase and loaded onto the surface of the stationary phase. Allowing the plate to interact with the gas phase prior to starting chromatographic development is called layer preconditioning, which is not possible with all types of developing chambers. Lining the chamber with filter paper soaked with developing solvent supports this process. In case that preconditioning is not desired, a counter glass plate arranged a few mm apart suppresses it. This is called sandwich configuration.

4. During solvent migration, the components of the mobile phase may be separated by the stationary phase under certain conditions, causing the formation of secondary fronts, which is usually not desired.

Influence of relative humidity (“activity of the layer”) with the same solvent migration distance.
Choosing a developing chamber

Selection of the “proper” chamber is done during method development and generally follows “practical” considerations such as which chamber is available, which one must be used due to an SOP or following a guideline, or which one has been used in the past if a results comparison is to be made. However, a focus should also be on economical aspects such as time requirement and solvent consumption and on reproducible conditions.

The Horizontal Developing Chambers have proven to be exceptionally economical, flexible and reproducible in operation. Although designed for applications where the plate is developed from two sides, they are also suitable for single-sided developments in unsaturated, saturated and sandwich configuration as well as for preconditioning of HPTLC plates. Please note that results are not comparable to vertical developing chambers.

The Automatic Developing Chamber 2 (ADC 2) is a software-controlled device for reproducible plate development. Unsurpassed for reproducibility and universal applicability in HPTLC. This instrument does not only eliminate any effects of the operator when introducing the plate into a saturated chamber, but also the activity of the layer prior to start of chromatography can be set and drying of the chromatographed developed plate is rapid, homogeneous, and complete. For development a conventional 20 x 10 cm Twin Trough Chamber is used. This way chamber geometry and chromatographic conditions of already existing analytical procedures can be retained, but environmental and operational effects are standardized.

In case the sample contains polar and non-polar components, which must be separated in the same analysis, the principle of AMD 2 System Automated Multiple Development can be employed. Development is performed on the basis of a solvent gradient from polar to non-polar over several steps with intermediate drying.

Definition of plate and chamber formats

These format definitions are used in all CAMAG literature.

Note: certain plates can be developed in one direction only, e.g. plates with a concentration zone or GLP coded plates.

Development without preconditioning

Development with preconditioning
CAMAG Flat Bottom Chamber

This is the classical developing tank for TLC/HPTLC. It permits the plate to be developed under conditions of partial or complete saturation of the tank atmosphere with solvent vapors. The degree of layer presaturation cannot be controlled unless additional accessories are used.

Twin Trough Chamber:

- **Low solvent consumption**
  
  20 mL of solvent are sufficient for a 20 × 20 cm chamber, 10 mL for the 20 × 10 cm chamber and 5 mL for a 10 × 10 cm chamber. This reduces not only solvent consumption but also disposal problems.

- **Reproducible preconditioning of the layer with solvent vapor**
  
  Developing solvent is placed in the trough opposite to the plate. Preconditioning can be performed with any solvent and for any duration. Development is started when developing solvent is placed into the trough with the plate.

Ordering information

- 022.5254 for plates 20 × 10 cm, with stainless steel lid
- 022.5253 for plates 20 × 10 cm, with glass lid
- 022.5251 for plates 20 × 10 cm, without lid
- 022.5155 for plates 10 × 10 cm, with stainless steel lid
- 022.5156 for plates 10 × 10 cm, without lid
CAMAG Horizontal Developing Chambers

In the Horizontal Developing Chambers, the HPTLC plates is can be developed from both opposing sides towards the middle. This permits the number of samples to be doubled as compared with development in a tank, provided the separation distance of 45 mm, i.e. 50 mm minus 5 mm distance from the edge, is sufficient. This chamber type is often used for screening purposes.

Plates can be developed in sandwich as well as in unsaturated and saturated chamber configuration. The chamber is suitable for all kinds of solvents.

CAMAG smartAlert solvent front monitor

The smartAlert serves for dependable monitoring the development of a glass plate in a glass developing chamber.

- Gives acoustic and visual notice when the mobile phase has reached the desired developing distance
- Replaces a timer or stop watch
- Works with glass chambers for plate sizes 20 × 20, 20 × 10 and 10 × 10 cm
- Battery operated

CAMAG smartCut plate cutter

Convenient and precise cutting of TLC/HPTLC plates

- Cuts glass plates with a thickness up to 3 mm
- Makes smooth cuts on sensitive layers
- Desired size can be read directly from a scale
- Easy handling

The ADC 2 offers convenience, safety and reproducibility for the isocratic development of HPTLC plates and foils with the format 20 × 10 cm. The ADC 2 is a device for reproducible plate development. It performs the development step fully automatically, and independent of environmental effects. The activity and pre-conditioning of the layer, chamber saturation, developing distance and final drying can be preset and automatically monitored by the ADC 2. Two modes of operation are possible: stand-alone with input of parameters via keypad, or remote operation from visionCATS with process monitoring, documentation of operating parameters, and reporting.

Key features
- Fully automatic development of 20 × 10 cm HPTLC plates
- A conventional 20 × 10 cm Twin Trough Chamber is used for development. This way, chromatographic conditions of already existing analytical procedures can be retained, but environmental and operational effects are excluded.
- Operation in stand-alone mode or software-controlled
- The user is freed of all process monitoring responsibilities, operation is fully traceable.
- The option “Humidity Control” allows reproducible chromatography at defined activity of the layer. This feature is essential in method development when the influence of relative humidity shall be investigated.

Detailed ordering information: www.camag.com/adc2

Note
The ADC 2 with visionCATS meets all the requirements of cGMP/cGLP and can be IQ/OQ qualified. If the instrument shall be used in a 21 CFR Part 11 environment, the visionCATS option “21 CFR Part 11” is required.
The AMD 2 is a software-controlled HPTLC chamber for gradient development. It is used for difficult analytical tasks that cannot be solved by isocratic HPTLC.

The separation of complex samples is a challenging task for every chromatographic system, particularly when they span a wide polarity range. The AMD procedure offers an excellent solution as it allows stepwise gradient elution over increasing separation distances. As a result, acids, bases, neutral, hydrophilic, and lipophilic substances can be separated in a single AMD run. This makes AMD suitable for a variety of fields of applications. The method is frequently used in lipid analysis and in routine analysis of drinking water. Pigment formulations with a complex composition, resins as well as additives of mineral oil products are other typical applications of AMD analysis.

The principle of the CAMAG AMD procedure

- The HPTLC plate is developed repeatedly in the same direction.
- Each successive run extends over a longer solvent migration distance than the one before.
- Between runs, the solvent is completely removed from the developing chamber and the layer is dried under vacuum.
- Each successive run uses a solvent of lower elution strength than that of the one used before. In this way, a stepwise elution gradient is formed.
- The combination of focusing effect and gradient elution results in extremely narrow bands. Their typical peak width is about 1 mm. This means that, within the available separation distance of 80 mm, up to 40 components can be completely resolved, i.e. with baseline separation.

The AMD 2, like other software-controlled CAMAG instruments, communicates with visionCATS. The gradient, made from up to 5 solvent bottles, is defined by input into a table in visionCATS. Gradient and solvent migration distance for each run can be shown graphically for verification. Then all individual runs of the developing program are performed fully automatic and monitored by visionCATS.

Key features

- Multiple development in the same direction with increasing solvent migration distances
- Enhanced separation capacity with baseline separation of up to 40 components
- Software-controlled with visionCATS
- Utilizing time also after working hours

Separation of various rhubarb samples by AMD 2

HPTLC chromatogram of Rhubarb under UV 366 nm, derivatized with Natural Product reagent: AMD gradient in 10 steps: methanol – dichloromethane (40:60) to (10:90) in 9 steps, 40 mm solvent migration distance, then one isocratic step methanol – dichloromethane (10:90) over 70 mm solvent migration distance

Ordering information

Derivatization

The possibility of straightforward derivatization is a special feature of TLC/HPTLC.
Pre- and Postchromatographic Derivatization

It is an inherent advantage of TLC/HPTLC that all fractions remain stored on the plate and can be readily derivatized after chromatography. Substances that do not respond to visible or UV light can be rendered detectable. In many cases, substances or classes of substances can be identified by specific reagents, enabling their selective detection.

Pre-chromatographic derivatization is possible by overspraying the sample application zones with the Linomat 5 or the Automatic TLC Sampler ATS 4.

For the transfer of liquid reagents for postchromatographic derivatization, one can choose between spraying or dipping. Dipping and automated spraying are the preferred techniques, particularly when a quantitative evaluation is intended. Usually reagent transfer by spraying can not be circumvented when two reagent solutions have to be applied in sequence without intermediate drying, for instance diazotation followed by coupling.

Whenever reagents are transferred by spraying, an efficient reagent mist removing device should be used to protect laboratory personnel against poisonous or irritating sprays or solvent vapors.

In most cases the derivatization reaction needs to be completed by heat treatment. Heating the plate at the desired temperature with a plate heater specifically designed for this purpose is highly recommended. An oven used for this purpose will become permanently contaminated.

Comparison of reagent transfer by automated spraying and dipping

Derivatization of Ginkgo leaf extracts with Natural Product reagent and polyethyleneglycol solution by spraying with 2 mL (above) and dipping in 200 mL (below)
CAMAG Chromatogram Immersion Device 3

For proper reagent transfer, the chromatogram must be immersed and withdrawn at a controlled uniform speed. By maintaining a well-defined vertical speed and immersion time, derivatization conditions can be standardized and “tide marks”, which can interfere with densitometric evaluation, are avoided.

Key features
- Uniform vertical speed, freely selectable between 2.5 cm/s and 4.5 cm/s
- Immersion time selectable between 0 and 8 seconds and indefinitely
- The device can be set to accommodate 10 cm and 20 cm plate height
- Battery operated, independent of power supply

CAMAG TLC Sprayer

The TLC Sprayer consists of a charger and a pump unit with two kinds of spray heads. Spray head type A is for spray solutions of normal viscosity, e.g. lower alcohol solutions. Spray head type B is for liquids of higher viscosity, e.g. sulfuric acid reagents.

Key features
- Easy to use, with electro-pneumatic spray function
- Formation of fine aerosol with particles of 0.3 to 10 µm
- Low reagent consumption

CAMAG Glass Reagent Sprayer

This all glass reagent sprayer is a low cost alternative to the TLC Sprayer. It comes with a rubber pump but may also be operated from a compressed air or nitrogen supply. The Erlenmeyer flask may be closed with a standard glass stopper.

022.6536 Reagent bottle 100 mL with cap, pack of 6
022.6537 Reagent bottle 50 mL with cap, pack of 6
022.6539 Service kit for TLC Sprayer
022.6100 Glass Reagent Sprayer, all glass, with 100 mL Erlenmeyer flask
CAMAG Derivatizer

Derivatization means another step in the process, consequently causing an increase in variance. Even if an experienced technician manually sprays a reagent, the relative standard deviation (RSD) of the measured values rises up to 12%. Using the Derivatizer, the RSD increases by less than 5%, thus providing very reproducible results, equal to those obtained with the Chromatogram Immersion Device, yet consuming considerably less reagent.

The Derivatizer sets a new standard of reproducibility and convenience in reagent transfer onto TLC/HPTLC plates by employing a unique “micro droplet” spraying technology (patent pending). The device is available for two different plate formats (20 x 20 and 20 x 10 cm) and is suitable for all common reagents.

In addition to the unsurpassed homogeneous reagent distribution, the Derivatizer offers other advantages as compared to manual spraying and immersion.

- Environmentally friendly and safe handling through a closed system
- Reproducible and user-independent results
- Low reagent consumption (2–4 mL) through efficient operation
- Intuitive handling and easy cleaning

Color-coded spray nozzles
Examples of derivatized chromatograms
Visual observation of results achieved with the Derivatizer reveals a very high homogeneity.

The nozzle generates an extremely fine reagent mist, which evenly distributes in the chamber and gradually condenses on the TLC/HPTLC plate.

The following most common reagents have been tested and validated by the CAMAG laboratory for use with the Derivatizer:
- Sulfuric acid reagent (10% in methanol)
- Anisaldehyde reagent
- Natural product reagent
- Polyethylene glycol solution
- Iodine solution (0.5% in ethanol)
- Dragendorff reagent
- Fast blue salt B reagent
- Ehrlich’s reagent
- Phosphomolybdic acid reagent
- Ninhydrin reagent
- Copper (II) sulfate reagent
- Aniline-diphenylamine-phosphoric acid reagent
- Vanillin reagent
- Potassium hydroxide solution (5% in methanol)
- Aqueous solutions (enzymatic solutions, etc.)

For alternative spraying reagents and reagents that are problematic to spray, please visit: www.camag.com/derivatizer

CAMAG TLC Plate Heater 3

The TLC Plate Heater is designed for heating a TLC/HPTLC plate to a selected temperature after a staining reagent has been applied. The Plate Heater has a CERAN® heating surface which is resistant to all common reagents and is easily cleaned. The 20 × 20 cm heating surface has a grid to facilitate correct positioning of the TLC/HPTLC plate. Programmed and actual temperature are digitally displayed. The temperature is selectable between 25 and 200 °C. The plate heater is protected from overheating.

Ordering information
022.3306 CAMAG® TLC Plate Heater 3
Stainless steel housing, flat ceramic top, for TLC/HPTLC plates up to 20 × 20 cm, digital temperature display, temperature range 25–200 °C.

CAMAG TLC Spray Cabinet 2

The TLC Spray Cabinet is designed for the complete removal of excessive spray mist while spraying a TLC/HPTLC plate with reagent. There is no deflection of the spray jet before it reaches the plate, an effect often encountered in a normal laboratory fume hood. Particles rebounding from the plate are completely removed. The Spray Cabinet is also useful for drying plates after development, with or without the assistance of a hair dryer.

The cabinet is made of PVC. The blower, a radial fan driven by a motor outside of the fume duct, produces an airflow of 130 cubic feet (3.7 cubic meter) per minute. The bottom of the spray cabinet has a built-in tray, which is removable for easy cleaning.

Ordering information
022.6230 CAMAG® TLC Spray Cabinet 2 with blower and flexible exhaust hose 1.5 m
022.6232 CAMAG® TLC Spray Cabinet 2 without blower, for connection to existing forced flow conduit, with 1.5 m flexible exhaust hose 127 mm diameter
022.6226 Exhaust hose extension 1.5 m with adapter
Chromatogram Evaluation

Scanning densitometry  ________________ TLC Scanner 4
Hyphenation of TLC/HPTLC with MS  ____ TLC-MS Interface 2
Chromatogram Inspection under UV Light

CAMAG UV Lamp 4

The UV Lamp 4 is designed primarily for use in a TLC/HPTLC laboratory. Users benefit from a convenient one-button operation for each UV tube. In order to reduce the user’s risk of UV radiation exposure, the UV Lamp 4 is equipped with two safety features: in addition to the built-in timer (which automatically switches off the lamp after 10 minutes) a tilt sensor automatically turns off the lamp in case the lamp is tilted more than 30 degrees. Beyond optimized handling and improved safety features, the UV Lamp 4 comes with a more homogeneous illumination and higher UV light intensity.

Key features
- Two UV tubes for illumination (1 × UV 254 nm, 1 × UV 366 nm, each 8 W)
- Convenient handling through one button operation for each UV tube
- Homogeneous illumination
- High level of user safety through tilt sensor and timer

Two types of UV light are required for inspecting chromatograms:

Long-wave UV light 366 nm
Under long-wave UV light fluorescent substances appear as bright, often differently colored zones, on a dark background. The sensitivity increases with the intensity of the UV light and also with the efficiency visible light is eliminated.

Short-wave UV light 254 nm
Under 254 nm UV light substances absorbing light of that wavelength appear as dark zones on a bright background, when the TLC/HPTLC layer contains a fluorescent indicator excited by UV 254 nm.

CAMAG UV Cabinet 4

The UV Cabinet 4, a combination of the UV Lamp 4 and the Viewing Box 4, is specially designed for UV observation with minimal influence of ambient light. Thanks to a compact footprint, the UV Cabinet 4 requires only minimum space. The observation port has a built-in UV filter in the viewing window ensuring effective eye protection. The interior is accessible via a roller shutter on the front.

Key features
- Chromatogram inspection with minimal influence of ambient light
- Eye protection through UV filter in the viewing window
- Minimum space requirements through compact footprint

Ordering information
040.2000 CAMAG® UV Cabinet 4, incl. CAMAG® UV Lamp 4 and CAMAG® Viewing Box 4
022.9160 CAMAG® UV Lamp 4, 254/366 nm, 2 × 8 W
022.9060 CAMAG® Viewing Box 4
For electronic image acquisition the camera – like the human eye – captures polychromatic visible light. Under white light illumination it is the light reflected from the layer background. Under long-wavelength UV light (366 nm) it is the light emitted by fluorescent substances. When short-wavelength UV light (254 nm) is used, substances absorbing UV 254 nm appear as dark zones, provided the layer contains a fluorescence indicator (fluorescence quenching).

The TLC Visualizer 2 is CAMAG’s imaging and documentation system operated with visionCATS. The software enables an image-based evaluation of chromatograms for quantitative evaluation.

The strength of the electronic image acquisition is the overview of the complete chromatogram.
CAMAG TLC Visualizer 2

Professional imaging and documentation system for TLC/HPTLC chromatograms and other planar objects with a state-of-the-art digital CCD camera, connected by USB 3.0.

The visual presentation of the complete chromatogram showing all samples and standards side by side is one of the most convincing arguments for (High-Performance) Thin-Layer Chromatography. No other chromatographic technique can directly express the result as a color image and make it available for visual evaluation.

To reproducibly acquire and preserve best quality images of TLC/HPTLC chromatograms under different illuminations this high-end imaging and documentation system is available. With its digital CCD camera a maximum resolution of 82 µm on the plate is obtained.

For electronic image acquisition the camera – like the human eye – captures polychromatic visible light. Under white light illumination it is the light reflected from the layer background. Under long-wavelength UV light (366 nm) it is the light emitted by fluorescent substances. When short-wavelength UV light (254 nm) is used, substances absorbing UV 254 appear as dark zones, provided the layer contains a fluorescence indicator (fluorescence quenching).

Note
The TLC Visualizer 2 with visionCATS meets all the requirements of cGMP/cGLP and can be IQ/OQ qualified. If the instrument shall be used in a 21 CFR Part 11 environment, the visionCATS option “21 CFR Part 11” is required.

Ordering information

**022.9810 CAMAG® TLC Visualizer 2 documentation system** with 12 mm lens. Suited for object formats up to about 21 × 28 cm (20 × 20 cm TLC plates). visionCATS software is not included.

**022.9811 CAMAG® TLC Visualizer 2 documentation system** with 16 mm lens*. Suited for object formats up to about 16 × 21 cm (20 × 10 and 10 × 10 cm TLC/HPTLC plates). visionCATS software is not included.

*16 mm lens leads to an increased image resolution for HPTLC plates

Detailed ordering information: www.camag.com/tlcvisualizer2

Key features
- Reproducible high-quality images acquired under homogenous illumination with the selected light
- Easy and intuitive operation with visionCATS
- High-dynamic-range imaging (HDRI)
- Side by side comparison of tracks originating from the same or different plates and/or different illumination modes
- Various image enhancement tools, e.g. Spot Amplification (“Spot Amp”), Clean Plate Correction and Exposure Normalization
- Image-based profile generation from reference and sample tracks, and subsequent peak integration and calibration
- New digital CCD camera with a maximum resolution of 82 µm on the plate
- USB 3.0 for easy PC connection
- Meets all requirements to be used in a cGMP/cGLP environment
- IQ/OQ qualification and 21 CFR Part 11 ready
**TLC Visualizer 2 operated under visionCATS**

*visionCATS* organizes the workflow of TLC/HPTLC, controls the involved CAMAG instruments, and manages data. Professional image acquisition and documentation of TLC/HPTLC chromatograms ensuring highest reproducibility is the major purpose of the TLC Visualizer 2.

For the evaluation of acquired images sophisticated enhancement tools and also functions for annotation and determination of position (hR) are required.

This is where *visionCATS* comes into play and virtually unleashes the power of TLC/HPTLC. *visionCATS* features a powerful database at its heart, enabling an all new sample-based approach. The state-of-the-art software supports low-noise, high-dynamic-range imaging (HDRI) and includes a comprehensive set of image enhancement tools.

With the “Comparison Viewer”, tracks originating from the same or different plates and/or different illumination modes can be compared on the same screen side by side which allows the creation of “virtual plates”. Detailed on-screen instructions effectively guide the user through the image acquisition process.
The BioLuminizer® 2 is a detection system specifically designed to detect bioluminescence on HPTLC plates. The BioLuminizer® 2 system is consisting of a compartment excluding any extraneous light, climate controlled for extended stability of the plate, and a 16 bit CCD digital camera of high resolution and high quantum efficiency. It features ergonomic design and easy, intuitive handling in standalone mode using the special software.

With the BioLuminizer® 2 bioactivity can be detected and registered economically and with short response time. Special antibacterial protection measures are not necessary, as the bioluminescent bacteria *Allivibrio fischeri* are non-pathogenic.

Hyphenating TLC/HPTLC and bioassay is an excellent tool for identification of single toxic compounds in complex sample matrices. The method is suitable for the detection of toxins in foodstuff, beverages, cosmetics, wastewater, drinking water, and for the detection of bioactivity in natural products. After chromatographic separation of the complex sample the plate is immersed in a suspension of bioluminescent bacteria *Allivibrio fischeri*. The reaction takes place within a very short time. All zones with inhibitory or toxic effects appear as dark zones on the luminescent plate background.

**Key features**

- Stand-alone operation using BioLuminizer® 2 Software
- Cooled 16 bit CCD camera with high resolution and high quantum efficiency
- Optimized plate compartment, which preserves a favorable environment for luminescent bacteria (the bacteria are kept moist)
- Small footprint
- Easy to clean

**Example**

Processed wastewater containing X-ray contrast media is frequently irradiated with UV light. The HPTLC bioluminescence image shows the bioactive effect of degradation products. As can be seen, an increase of the irradiation time generates substances with a distinctively inhibitory effect on the luminescent bacteria. In a cuvette test, this inhibitory effect would have been masked by degradation products.

The example is taken from an internship report at the “Zweckverband Landeswasserversorgung” in Langenau, Germany.

**Ordering information**

022.9750 CAMAG BioLuminizer® 2 for detection of bioluminescence patterns on HPTLC plates, including software

Detailed ordering information: www.camag.com/bioluminizer
In scanning densitometry the tracks of the chromatogram are scanned with monochromatic light in the form of a slit selectable in length and width. The spectral range of the TLC Scanner 4 is 190–900 nm. Reflected light is measured either in the absorbance or in the fluorescence mode. From the acquired data quantitative results are computed with high precision and spectral selectivity.

With the TLC Scanner 4 absorption spectra can be recorded. The strengths of classical densitometry as compared with image evaluation are spectral selectivity and the higher precision of quantitative determinations.

Recommendations
Applying samples in the form of narrow bands allows densitometric evaluation by aliquot scanning, i.e. scanning with a slit about \( \frac{2}{3} \) of the track width. This improves reproducibility as the center portion of the sample zone is homogeneous and positioning errors, which can occur with samples applied as spots, are avoided.

For quantitation sample zones should always be scanned with the wavelength of maximum absorbance which can be determined by spectra recording or by multi-wavelength scanning.
The TLC Scanner 4 is the most advanced workstation for densitometric evaluation of TLC/HPTLC chromatograms and other planar objects. All functions of the TLC Scanner 4 are controlled by visionCATS software. Only positioning of the object to be measured is performed manually and, if desired, switching on the internal illumination to assist correct positioning. Optimal settings of the electronic amplification are automatically selected for scanning in absorbance or fluorescence mode respectively.

The 16 bit A/D converter ensures optimally adapted resolution of the measurement signal.

Key features

- Measurement of reflected light, either in absorbance or fluorescence mode
- Object formats up to 20 x 20 cm
- Spectral range from 190 to 900 nm
- Automatic start of all lamps: deuterium, halogen-tungsten, and high pressure mercury lamp
- Data step resolution 25–200 µm
- Scanning speed 1–100 mm/s
- Spectra recording up to 100 nm/s
- Automatic selection of electronic amplification
- Rapid data transfer
- Meets all requirements to be used in a cGMP/cGLP environment
- IQ/OQ qualification and 21 CFR Part 11 ready

**Ordering information**

**027.6200 CAMAG® TLC Scanner 4**, for the densitometric evaluation of TLC/HPTLC chromatograms, spectral range 190 to 900 nm, plate sizes up to 20 x 20 cm, absorbence and fluorescence mode, *visionCATS* controlled

Detailed ordering information: www.camag.com/tlcspecifier

**Note**

The TLC Scanner 4 with *visionCATS* meets all the requirements of cGMP/cGLP and can be IQ/OQ qualified. If the instrument shall be used in a 21 CFR Part 11 environment, the *visionCATS* option “21 CFR Part 11” is required.
Evaluation with *visionCATS*

*visionCATS* controls the TLC Scanner 4 and enables quantitative evaluation of the generated densitometric data. To determine the substance concentration in a sample, five different quantification functions (e.g. linear and polynomial) are available. Several scanning steps (e.g. scanning the plate after development and scanning the same plate after derivatization) and up to five different evaluations can be performed (with data obtained from single wavelength, multiple wavelengths or a combination of measurements in absorption and fluorescence detection mode).

**The Scanner Ultimate Package:**

- **Multi Wavelength**: this feature offers the possibility to perform a multi-wavelength scan with up to 31 selected wavelengths or a combination of measurements in absorption and fluorescence detection mode.
- **Scanner Quantification**: this feature allows to quantify each individual substance on the plate. Five different quantification functions are available for evaluation to determine the concentration of the substance in a sample. In one analysis file up to five evaluation steps can be performed in multiple plate states (e.g. plate after development and same plate after derivatization).
- **Spectrum Scanning**: this feature includes the measurement of the spectrum of each individual substance on the plate including the evaluation of the substance purity by comparison with reference standard.

Peak Assignment: the separated compounds are assigned. For quantification, data from the multi-wavelength scan at the optimum wavelength for each compound is used.

3D View and Peak Integration: densitograms are displayed in 3D, top or front view. Several peak integration and baseline correction settings can be selected.

Calibration Curve: for evaluation the best fitting calibration model is used. Quantitation can be done via peak height or area.
The elution-based TLC-MS Interface 2 is a highly convenient and versatile instrument allowing for rapid and contamination-free elution of TLC/HPTLC zones with direct transfer to a mass spectrometer.

Through the pioneering concept of hyphenating High-Performance Thin-Layer Chromatography with Mass Spectrometry unequivocal substance identification is possible. The TLC-MS Interface 2 can be installed plug & play with any LC-MS system without adjustments or mass spectrometer modifications. Depending on the MS system, a substance can be identified within a minute via its mass spectrum, or for an unknown substance zone, the respective sum formula can be obtained. Furthermore, interesting zones can be eluted into vials for further investigations with, e.g., NMR, (ATR-)FTIR, ESI-MS, and MALDI-MS.

The chromatogram zones are eluted from the HPTLC plate with methanol or another suitable solvent with the flow speed appropriate for the LC-MS system. The round elution head is used for circular zones and the oval elution head for zones in the form of bands. After elution the eluate is either directly transferred to the mass spectrometer or collected in a sample vial for further offline analysis.

The TLC-MS Interface 2 features a modified elution head and an easily accessible, exchangeable filter, arranged in front of the valve. Cleaning is facilitated as compared to the previous version, making it highly efficient. By pushing a button, the elution path is cleaned of matrix particles with compressed air, increasing the lifetime of the filter and preventing the system from becoming blocked. These filters can be easily replaced without any modification to the elution head.

Plate positioning is significantly simplified: together with the positioning scale and the adjustable plate-stopper, the integrated crosshair laser enables accurate and reproducible positioning of the plate. Alternatively the coordinates determined by the TLC Visualizer 2 or the TLC Scanner 4 can be used to precisely position the HPTLC plate.

Key features
- Rapid and contamination-free elution of selected zones
- Direct transfer to any mass spectrometer
- Plug & play installation
- Compatible with any LC-MS system
- Confirmation of known substances within a minute
- Highly effective backwashing function prevents the elution path from becoming blocked
- Easy handling ensures accurate and reproducible plate positioning
- Low solvent consumption

Ordering information

Characterization of separated compounds by mass spectrometry (Steviol glycosides in Stevia formulations*)
*A: Chromatogram for localizing the zones (derivatized with β-naphtol reagent)
B: HPTLC plate after elution of zones with the CAMAG TLC-MS Interface 2
Software

visionCATS
visionCATS HPTLC Software

HPTLC Analysis – made easy

visionCATS stands for ease of use and intuitive simplicity. The software organizes the workflow of HPTLC, controls the involved CAMAG instruments, and manages data.

The easy to navigate user interface effectively guides the user through the chromatographic process – from definition of samples and substances to reporting of results. Simply select one of the default methods and start working: fill in the sequence table, select a mobile phase and the derivatization reagent.

If necessary modify detection parameters. Then visionCATS will guide you. Creating your own method is easy as well: just select the desired steps. The new sample-oriented approach allows for creating virtual plates from tracks originating from different plates, e.g. for batch-to-batch comparison or long-term stability testing.

With visionCATS relevant samples can be located easier and faster than ever: a powerful search tool within the file explorer that includes extended preview functionalities enables the user to easily search for text and date, samples, methods, and analysis files.

Sample View: all available data related to the sample are displayed
Guided Analysis: select a method and visionCATS will guide you

HPTLC Analysis – made easy: create your own method with a few mouse clicks
Key Features

Image Comparison Viewer
With the fully integrated Image Comparison Viewer tracks originating from the same or different plates and/or different detection modes can be compared on the same screen side-by-side.

Image Enhancement Tools
visionCATS supports low-noise, high-dynamic-range imaging (HDRI) and includes a comprehensive set of Image Enhancement Tools.

Scanning Densitometry and Spectral Evaluation
Following their chromatographic separation substances on the plate can be measured by Scanning Densitometry. Recording of UV/Vis spectra and their comparison with reference spectra allows identification.

Quantitative Analysis
To determine the substance concentration in a sample after densitometric or image analysis, five different quantification functions (e.g. linear and polynomial regression modes) are available. Several scanning steps and up to five different evaluations can be performed in one analysis file.

HPTLC Method Library
For seamless import of validated methods and images of standards and reference materials, visionCATS provides a free of charge HPTLC Method Library for licensed users.

Regulatory Compliance
visionCATS supports compliance with cGMP/cGLP and 21 CFR Part 11.

State-of-the-art Software Architecture
visionCATS is based on a client/server system, enabling scalability from a single workstation to a multi-user lab network.
Complete Systems
Consumables
An advanced HPTLC system for more demanding tasks consists of at least one instrument for the steps sample application, chromatogram development, derivatization, and detection. The TLC Scanner 4 in conjunction with visionCATS software enables quantitative evaluation of the generated densitometric data.

Ordering information

041.1300 CAMAG® HPTLC System for quantitative analyses including densitometric evaluation and image documentation, including visionCATS software for control of instruments. Suitable for laboratories with high sample throughput.

041.1200 CAMAG® HPTLC System for quantitative analyses including densitometric evaluation and image documentation, including visionCATS software for control of instruments. Suitable for laboratories dealing with few samples.

041.1400 CAMAG® HPTLC System for qualitative analyses based on image documentation and image-based evaluation, including visionCATS software for control of instruments. Suitable for laboratories dealing with few samples.

CAMAG Services

Competent Advice
Training Courses
CAMAG Bibliography Service
CAMAG HPTLC Laboratory offers analytical support with focus on HPTLC (High-Performance Thin-Layer Chromatography). The pharmaceutical, botanical and food industries are facing increasingly stringent regulation concerning product safety and quality. HPTLC is a fully reproducible, standardized, and cGMP-compliant technique. It can be the method of choice for many analytical tasks.

1) Feasibility studies
Following a detailed discussion of the analytical goal with the customer, the lab can evaluate whether HPTLC or TLC can offer an advantageous solution.

2) Consulting and training
CAMAG helps you get started! Whether you intend setting up a new lab, ensuring compliance with cGMP, or you are dealing with the authorities concerning registration, we can offer HPTLC solutions that save you time, hassle and money. Select one of our courses or let us provide customized training at your site to stay up-to-date with new developments in HPTLC technology. Let us show you how to optimally use your equipment, get reliable results, and develop and validate methods yourself.

3) Applied research
We offer guest residences at our laboratory for students, scholars, and researchers to engage in research projects. These are focused on, but not limited to practical aspects of HPTLC and analysis of botanicals. We publish results in journals, textbooks, through conferences and seminars as well as on our website. It is our goal to make available to the public high quality data illustrating the capabilities of HPTLC.

CAMAG is also your partner when it comes to education and training in the field of High-Performance Thin-Layer Chromatography. Select one of our courses to stay up to date with new developments in HPTLC methodology and technology. Let us show you how to properly use your equipment, get reliable results, and develop and validate methods yourself.

CAMAG offers HPTLC training courses on the following topics:
• HPTLC Today: qualitative and quantitative HPTLC; coupling techniques; gradient development; HPTLC bioautography
• HPTLC for the analysis of botanicals
• Method development and validation in HPTLC

Current training course schedule:
www.camag.com/courses
Instrument Qualification

For customers working in a cGxP regulated environment, CAMAG offers Installation Qualification (IQ) and Operation Qualification (OQ) as service.

The Installation Qualification (IQ) is performed on site and at the time of installation. It documents that all key aspects of the installation comply with the manufacturer’s specifications, codes, safety and design parameters.

The Operation Qualification (OQ) is performed subsequent to installation and is repeated at certain intervals recommended by the manufacturer or defined by the customer. It documents that all modules of the equipment perform consistently throughout the specified operating ranges.

A Performance Qualification (PQ) is an ongoing process which documents that the instrument or system is suitable for the given task. Accordingly, only the customer himself can perform PQs, employing his substances and following his specific task descriptions and test procedures (SOPs).

CAMAG offers qualification procedures for the following products:
- AMD 2 System Automated Multiple Development
- Automatic Developing Chamber 2 (ADC 2)
- Automatic TLC Sampler 4 (ATS 4)
- DigiStore 2
- Derivatizer
- Linomat 5
- TLC Scanner 3
- TLC Scanner 4
- TLC Visualizer
- TLC Visualizer 2
- TLC-MS Interface
- TLC-MS Interface 2
- UV Lamp 4
- VideoScan
- visionCATS HPTLC Software
- winCATS – Planar Chromatography Manager
CAMAG Bibliography Service (CBS) - Planar Chromatography

CAMAG has been publishing the customer magazine CAMAG Bibliography Service CBS since 1965. The CBS is issued two times per year and focuses on recent examples of HPTLC in practice. Typical examples from research and industry, mainly written from customers, are demonstrated in each issue. Articles come from a broad variety of application fields.

Cumulative CAMAG Bibliography Service (CCBS)

With the CCBS Online Search, you can directly search for information within the CAMAG website. The CCBS covers more than 11'000 abstracts of TLC/HPTLC publications between 1982 and today. The database covers most relevant scientific journals in the field of Planar Chromatography including also various non-English publications in German, French, Spanish, Portuguese, and Chinese. The CCBS features additional practical information for the analyst in the lab, for example details on the mobile phase or the detection. With CCBS the analyst is able to find relevant TLC/HPTLC publications which might be helpful for solving a particular analytical question.

Visit www.camag.com/ccbs and choose your preferred search option:
- Full text search
- Browse and search by CBS classification
- Alphabetic Search
- Search by CBS edition

Application Notes

HPTLC is the method of choice for many analytical tasks – a broad range of Application Notes is available for download. Registered users can download the Application Notes for free.

CAMAG Laboratory develops and validates HPTLC methods for herbal drugs, food, cosmetics, forensics, and other application fields. By following these methods, using the recommended instruments and software, reproducible results are guaranteed. A standardized methodology according to the International Association for the Advancement of HPTLC is followed.

Specifications are subject to change without notice
CAMAG markets its products in Switzerland directly from the headquarters, in Germany and the United States through their subsidiaries. In more than 70 other countries CAMAG is represented by selected companies. CAMAG distributors regularly send their product specialists for education and training to our headquarters. Furthermore CAMAG organizes training courses overseas, e.g. in the Far East. The task of CAMAG product specialists is to advise customers in system selection and application competence and in the operation of their CAMAG systems. Service engineers of our distributors are regularly trained in Muttenz.

To our customers and distributors a comprehensive web-based information offer is available: www.camag.com for product and company information, www.camag-laboratory.com for applications.

CAMAG is a flexible, customer-oriented and scientifically sound company, which in its 60 years company history has profiled as a valued partner in all areas of Planar Chromatography.
